

Tipelodeon — What This App Does

Tipelodeon is an app for live musicians. It helps a performer keep track of every song they can play, organize them into setlists for a gig, store sheet music, take song requests from the audience, and get tipped.

It runs on your phone, your laptop, or any computer. The audience uses it from a regular web browser — no app to install.

Money flows straight from the audience to the performer's bank account. The platform never holds onto it.

What performers can do

Sign up for free

Make an account with your email. Tipelodeon is free for performers — no subscription, no trial.

Build a "project" for each act

A project is one band or one solo act. You can have more than one — say, one for your jazz trio and another for your acoustic solo shows. Everything below lives inside a project.

You can invite bandmates to a project. Each bandmate gets their own copy of the songs and charts inside the project, so they can mark them up however they want without messing up yours.

Manage your songs (your repertoire)

Your repertoire is your master list of songs. Add as many as you want.

- Add a song by title and artist. The app fills in extra details for you — energy level, era (50s through 2020s), genre, the song's original key, length, tempo, and a "theme" tag like party, love, worship, story, Christmas, Halloween.
- Write down the key you actually play it in, your tuning, your capo, and your own notes.
- Tag songs as "still learning," "public" (so the audience can see it) or "private," "instrumental," "original," or "mashup."
- Make a second version of any song — an "acoustic" version next to the regular one.
- Update a bunch of songs at once.
- Copy songs from one of your projects into another.
- Search, filter, and sort however you want.

Store and mark up sheet music

- Upload a PDF chart for any song.
- The app shows it on stage with crisp light-mode and dark-mode versions.
- Zoom and pan — the app remembers your position for next time.
- Draw on top with your finger or stylus. Pick a color, change brush size, erase, undo, redo. Your notes save automatically.
- Ask the AI to make you a lyric sheet for a song.
- Every chart is downloaded to your phone so you can still see it when there's no signal.

Attach practice recordings

Add up to 3 MP3 files per song — like a practice recording or the original track for reference. These are just for you to listen to. The app never plays them for the audience.

Build setlists

- Make a setlist for a gig.
- Inside it, make "sets" — "Dinner Set," "Party Set," "Encore."
- Drop songs into sets. Drag to reorder. Add notes that show up between songs. Color-code songs.
- Duplicate a setlist as a starting point for the next one. Archive it after the show.
- Ask AI to build a setlist for you. It looks at what you've played before and groups songs from your repertoire into the number of sets you ask for.
- Snap a photo of a handwritten setlist and AI pulls the songs out of it.
- Share a setlist with a bandmate by sending a link.

Run a performance session (a show in progress)

When the show starts, you tap "Start." The app asks where you are (it can suggest a venue based on GPS) and you're off.

- Pick a setlist mode or a free-play mode.
- Mark songs as played, skip them, or hit "random" to grab a random song.
- Audience requests roll in automatically and attach to the current show.
- If someone in the audience interacts with your page before you've hit "Start," the app quietly starts a session so the request is captured. When you officially start, it just takes over.
- See live stats during the show — who tipped, top songs, total tips.
- After the show, get an AI-written recap.
- Chat with an AI about your session — ask it questions about the gig.
- Edit a past session if you got the venue or time wrong.

Take requests from the audience

The request queue is the live list of songs people are asking for, right now.

- See requests in order: biggest tip at the top, then by who asked first.
- Mark a song as played to clear it.
- Add a song manually — maybe someone asked you in person and slipped you cash.
- Drag to reorder.
- The list updates every few seconds on its own.
- Cooldown: if a song was just played, it won't show up as requestable for a while — unless someone tips enough to "bust" the cooldown.
- No repeats: you can block the same song from being played twice in one show.

Log cash tips

After a show, type in how much cash you collected. The app counts it toward your "best day" record and your session stats, but keeps it separate from digital tips so you can see the breakdown.

Set up loyalty rewards for fans

When a fan's total tips cross a tier, they earn a reward.

- Every new project comes with a default tier: every \$30 in tips, the fan earns a free request.
- Add custom tiers — for example, every \$50 = a piece of merch.
- Repeating tiers fire every time (every \$30, every \$50). One-time tiers fire once.
- When the reward is something you hand over in person, the app tracks "delivered."
- A fan's total only goes up — it's a loyalty count, not a balance they spend down.

See venue analytics

- Save the venues you play at.
- When you start a session, the app suggests venues you've played at before, or nearby venues other Tipelodeon performers have played at, or anywhere Google says is close.
- See analytics per venue — your top songs there, what days of the week are best, how the tipping has gone.
- Peek at how other performers have done at a venue (only if at least 3 different performers have played there, to protect privacy).

Get paid directly

- Tipelodeon uses Stripe Connect. That means money goes straight to your bank account — it never sits in Tipelodeon's account.
- Set up your payout account by clicking a link in the app.
- See your earnings broken down by time period (today, this week, last month, all time, custom) and by show.
- Audience members pay a flat \$2 platform fee on top of every tip. The performer always nets the full tip amount.
- Tipelodeon takes no cut beyond that \$2.

See what's trending

See the top 5 most-requested songs in your country across all Tipelodeon performers (only counts songs at least 3 different performers have had requested).

The app works without internet

Everything is saved on your device. Open the app on a dead phone signal and your songs, charts, and MP3s are still there. When you reconnect, anything you changed gets synced up to the server.

What audience members can do

Audience members don't need an account. They just open your page in a browser.

Browse your songs

Search, filter, and sort your public repertoire. Little "Hot tonight" badges show what's popular at the moment.

Embed your songs on your own website

Paste a snippet onto your website and your repertoire shows up in a little window for visitors to browse.

Request a song

- Tap a song. Pick a tip amount (preset buttons or type your own).
- Add an optional note ("Happy birthday to my mom!").
- Pay with credit card, Apple Pay, Google Pay, Link, or Cash App.
- The app tells the audience member exactly where in the queue their request will land based on their tip amount.
- If they've earned a free request, they can claim it without paying.

Just tip without a song

Sometimes someone just wants to throw money in the jar. The tip still counts toward their loyalty total

for rewards.

Other little things

- Ask the performer to play one of their own songs.
 - Visit the performer's website or follow them.
 - Suggest a whole setlist for them.
-

What's changing next — the new bulk import

The current bulk-import wizard (a four-step flow for uploading songs in batches) is getting replaced. Here's what's coming.

A command bar — like a search box with magic

Picture the Spotlight search on a Mac, or the search bar on your phone. You type, and suggestions appear as you type.

That's what the new bulk import will feel like. Type a song title (or "Artist — Title"). As you type, the app streams song suggestions back at you. Each suggestion shows:

- The song name and artist.
- Whether a chart already exists for it in the community.
- Options to attach a chart: pick one from the community, upload your own PDF, ask AI to make a lyric sheet, or just add the song without a chart for now.

One tap and the song is added to your repertoire. If nothing matches what you typed, the bottom of the list will say "Add as a new song" and you can create it right there.

That single search box replaces all the old input modes — PDF picker, paste-a-list, paste-text, snap-a-photo-of-a-setlist — into one box that knows what to do based on what you're typing or dragging in.

An MP3 matcher

You can also drop MP3 files into the import. For each MP3, the app does one of two things:

1. **Match it to a song you already have.** The app uses the audio fingerprint, the MP3's built-in tags (artist, title, album), and the file name to guess which song in your repertoire it belongs to. If it's a confident match, it attaches the MP3 as a reference recording.
2. **Make a new song from the MP3.** If nothing matches, the app reads the MP3's tags and creates a new song in your repertoire using that info. AI fills in the rest (energy, era, genre, key, tempo, theme).

Both paths flow into the same command-bar list, so dropping MP3s and typing queries live next to each other.

Audio files stay just for the performer — never streamed to the audience.
